

Stop handling tickets. Start eliminating what's causing them.

Snowflow transforms support ticket data into a clear view of what is driving demand, where risk is building, and what leadership should fix first to reduce ticket volume and lower support costs.

Generated: 4/16/2026, 9:10:56 PM
Product Areas Analyzed: Integrations, Dashboard, Mobile, Auth, API, Billing
Total Tickets: 896

Executive Summary

What this means

The top 3 drivers account for 25.7% of total support volume, indicating a concentrated opportunity to reduce demand at the source. These issues are primarily driven by product instability, system performance gaps, and workflow friction that are creating repeatable support load.

Business Impact

- Reduce unnecessary ticket volume driven by recurring issues
- Lower total support costs by addressing preventable demand
- Increase team efficiency by shifting effort away from repetitive work
- Improve customer experience by resolving high-friction root causes
- A 20–30% reduction in these drivers would materially decrease support workload and improve operating efficiency

Top Focus Areas

01

Authentication Errors

This driver has the highest ticket count (85), indicating a significant disruption for users trying to integrate with third-party services, directly impacting user satisfaction and retention.

02

Performance Lags

With 75 tickets related to slow loading times on the dashboard, resolving performance lags is crucial for maintaining user engagement and satisfaction.

03

Connectivity Issues

The 70 tickets concerning unstable network connections highlight a major barrier affecting mobile app usage, which can lead to decreased user satisfaction and increased frustration.

Top Ticket Drivers

These are the top 10 highest-volume recurring drivers contributing to support demand across the environments reviewed.

Rank	Driver	Product Area	Tickets	% of Volume
1	Authentication Errors	Integrations	85	9.5%
2	Performance Lags	Dashboard	75	8.4%
3	Connectivity Issues	Mobile	70	7.8%
4	Authentication Failure	Auth	60	6.7%
5	Data Synchronization Issues	Integrations	60	6.7%
6	Usability Issues	Dashboard	55	6.1%
7	Authentication Failures	API	52	5.8%
8	App Crashes	Mobile	50	5.6%
9	Inaccurate Billing Amounts	Billing	45	5%
10	User Interface Confusion	Auth	40	4.5%

Root Cause Breakdown

These findings are grouped into broader operational themes to make the highest-leverage opportunities easier to evaluate and act on.

Authentication Issues

INTEGRATIONS

Authentication Errors

Root Cause: Users are frequently encountering authentication-related issues when integrating with third-party services.

Confidence: High

RECOMMENDED ACTIONS

- Conduct a review of the authentication process to identify and fix common failure points.
(Engineering, High)

AUTH

Authentication Failure

Root Cause: Users frequently encounter errors when attempting to log in, often related to incorrect credentials or system authentication issues.

Confidence: High

RECOMMENDED ACTIONS

- Investigate and resolve root causes of authentication failures by enhancing password reset protocols and improving error messaging. (Engineering, High)

DASHBOARD

Performance Lags

Root Cause: Users report slow loading times and unresponsive features within the dashboard.

Confidence: High

RECOMMENDED ACTIONS

- Optimize loading speed of the dashboard to reduce performance lags. (Engineering, High)

MOBILE

Connectivity Issues

Root Cause: Frequent problems related to unstable or lost network connections affecting app performance.

Confidence: High

RECOMMENDED ACTIONS

- Investigate and resolve underlying issues causing frequent connectivity problems. (Engineering, High)

Billing & Revenue Risk

BILLING

Inaccurate Billing Amounts

Root Cause: Users are reporting discrepancies between expected and charged amounts.

Confidence: High

RECOMMENDED ACTIONS

- Review and correct billing calculation algorithms. (Billing, High)

BILLING

Payment Processing Failures

Root Cause: Tickets frequently mention failed payment attempts leading to service interruptions.

Confidence: High

RECOMMENDED ACTIONS

- Investigate and improve payment processing reliability. (Engineering, High)

Integrations & Data Flow

INTEGRATIONS

Data Synchronization Issues

Root Cause: There are significant problems with the synchronization of data between the product and external systems.

Confidence: High

RECOMMENDED ACTIONS

- Implement automated monitoring and alerts for data synchronization failures. (Engineering, High)

API

Documentation Errors

Root Cause: Customers report unclear or incorrect information in API documentation that leads to misuse of endpoints.

Confidence: Medium

RECOMMENDED ACTIONS

- Update API documentation to clarify common points of confusion. (Knowledge Base, Medium)

INTEGRATIONS

Configuration Challenges

Root Cause: Many users report difficulties in configuring their integrations properly, leading to misuse or incorrect setups.

Confidence: Medium

RECOMMENDED ACTIONS

- Create detailed configuration guides and FAQs to assist users with integration setups. (Knowledge Base, Medium)
- Develop a guided setup wizard for new integrations to ensure correct configurations. (Automation, Medium)

User Experience Issues

MOBILE

User Interface Inconsistencies

Root Cause: Inconsistencies in the user interface, such as elements not displaying correctly, causing confusion for users.

Confidence: Medium

RECOMMENDED ACTIONS

- Conduct a thorough review of the mobile app's user interface to rectify inconsistencies. (UI/UX, Medium)

DASHBOARD

Usability Issues

Root Cause: Users experience difficulties in navigating or using features effectively.

Confidence: High

RECOMMENDED ACTIONS

- Redesign user interface based on user feedback for better navigation. (Usability, High)

API

Rate Limiting Issues

Root Cause: Several tickets indicate that users are exceeding the rate limits, resulting in their requests being blocked.

Confidence: Medium

RECOMMENDED ACTIONS

- Review and adjust rate limit parameters based on usage patterns. (Monitor, Medium)

Operational Risk & Impact

Impact Summary

The majority of support demand is driven by a few critical issues, indicating significant weaknesses in system stability and customer communication. This results in heightened operational strain and risks compromising customer satisfaction and team productivity.

Operational Pressure

Resources are overwhelmed by recurring support requests, limiting the ability to manage emerging problems and innovate effectively.

Key Risks

- Increased customer frustration leading to churn
- Team burnout due to repetitive high-volume issues
- Scalability challenges as demand grows with unresolved issues

Next-Step Priorities

These actions represent the most immediate opportunities to reduce repeat support demand and improve operating leverage.

PRIORITY 1

Authentication Errors

Why this matters: This driver has the highest ticket count (85), indicating a significant disruption for users trying to integrate with third-party services, directly impacting user satisfaction and retention.

RECOMMENDED ACTIONS

- Conduct a review of the authentication process to identify and fix common failure points.

Expected Outcome: Enhancing the authentication process will reduce ticket volume and improve user experience when integrating with services.

PRIORITY 2

Performance Lags

Why this matters: With 75 tickets related to slow loading times on the dashboard, resolving performance lags is crucial for maintaining user engagement and satisfaction.

RECOMMENDED ACTIONS

- Optimize loading speed of the dashboard to reduce performance lags.

Expected Outcome: Improving dashboard performance will enhance usability and decrease support requests related to speed issues.

Connectivity Issues

Why this matters: The 70 tickets concerning unstable network connections highlight a major barrier affecting mobile app usage, which can lead to decreased user satisfaction and increased frustration.

RECOMMENDED ACTIONS

- Investigate and resolve underlying issues causing frequent connectivity problems.

Expected Outcome: Addressing connectivity issues will enhance app reliability, leading to higher user satisfaction and reduced ticket volume.

What Happens Next

What Happens Next

Snowflow translates these findings into a prioritized action plan designed to reduce support demand at the source.

- Deep-dive into the top 3 drivers and validate the underlying causes
- Implement the highest-value corrective actions across product, process, and automation
- Monitor impact over time and validate whether ticket volume declines in the targeted areas

Want to move from insight to execution? Snowflow can take these findings into an implementation roadmap, recurring RCA review, and ongoing monitoring layer tailored to your support environment.
